chemistry in the last century was characterized by spectacular growth and advances stimulated by revolutionary theories and experimental breakthroughs yet despite this rapid development the history of this scientific discipline has achieved only recently the status necessary to understand the effects of chemistry on the scientific and technological culture of the modern world this book addresses the bridging of boundaries between chemistry and the other classical disciplines of science physics and biology as well as the connections of chemistry to mathematics and technology chemical research is represented as an interconnected patchwork of scientific specialties and this is shown by a mixture of case studies and broader overviews on the history of organic chemistry theoretical chemistry nuclear and cosmochemistry solid state chemistry and biotechnology all of these fields were at the center of the development of twentieth century chemistry and the authors cover crucial topics such as the emergence of new subdisciplines and research fields the science technology relationship and national styles of scientific work this monograph represents a unique treasure trove for general historians and historians of science while also appealing to those interested in the theoretical background and development of modern chemistry

in spite of the increasing presence of renewable energy sources fossil fuels will remain the primary supply of the world's energy needs for the upcoming future modern gas turbine based systems represent one of the most efficient large scale power generation technology currently available alongside this gas turbine power plants operate with very low emissions have flexible operational characteristics and are able to utilize a broad range of fuels it is expected that gas turbine based plants will play an important role as an effective means of converting combustion energy in the future as well because of the vast potential energy savings the numerical approach to the design of complex systems such as gas turbines has gained a continuous growth of

interest in the last few decades this because simulations are foreseen to provide a tremendous increase in the combustor efficiency fuel flexibility and quality over the next future in this dissertation an advanced turbulent combustion technique is implemented and progressively developed for the simulation of all the features that are typically observed in stationary gas turbine combustion including hydrogen as a fuel the developed turbulent combustion model retains most of the accuracy of a detailed simulation while drastically reducing its computational time as a result of this work the advancement of power generation plants can be accelerated paving the way for future developments of alternative fuel usage in a cleaner and more efficient combustion
